Filtering using filter_logic helper and added courses_filter endpoint

```python
def filter_logic(category: str = None, min_price: int = None, max_price: int = None, is_published: bool = None):
    result = courses
    if category is not None:
        result = [c for c in result if c['Category'].lower() == category.lower()]
    if min_price is not None:
        result = [c for c in result if c['price'] >= min_price]
    if max_price is not None:
        result = [c for c in result if c['price'] <= max_price]
    if is_published is not None:
        result = [c for c in result if c['is_published'] == is_published]
    return result
```

```python
#------ Q10------------------------------------------------------------

@app.get('/courses_filter')      Pin selection to current chat prompt (Ctrl+Alt+X) | Don't
def filter_courses(
    category:     str  = Query(None),
    min_price:    int  = Query(None, ge=0),
    max_price:    int  = Query(None, ge=0),
    is_published: bool = Query(None)
):
    result = filter_logic(category, min_price, max_price, is_published)
    return {'total': len(result), 'results': result}
```
